VSc Solutions to offer WMS Solutions to Southern African Companies

September 2013

VSc Solutions have now joined forces with LA Software in Turkey. This will be a mutually beneficial relationship and will allow both companies to resell the others software within their respective territories. We are therefore in the process of translating the DRM into Turkish and have already started identifying potential customers. In addition to the above, VSc Solutions have added LA's Warehouse Management Software to its local offering to its customers.

Today's ever evolving global logistics environment makes it nearly impossible for inflexible and antiquated technologies to provide the support and automation function they were originally purposed for. Instead, supply chain technologies require the capability to cater for a more dynamic supply chain environment, offering the ability to manage and adapt to changes on demand in order to ensure that efficiencies and value are consistently achieved.

The LO Warehouse Management System (WMS) solution has been successfully implemented in hundreds of warehouses and distribution centers globally through supply chain specialists. In line with this, VSc Solutions, South African supply chain technology experts, are now the preferred partner for the introduction of LO WMS to the South African & Sub-Saharan African markets. The software enables the management of different warehousing processes across multiple principles' product groups and caters for a variety of requirements in the same application, ultimately optimizing capacity and resource utilization.

Integrating complimentary supply chain solutions, for example, WMS with distribution optimisation solutions like route planning and route compliance management tools provides organisations with the competitive edge needed to compete both locally and in the global arena through realizing substantial cost savings in operations and continuous customer service level improvements.
